Natural Sciences

Description and Learning Outcomes

The Mason Core Natural Sciences courses engage students in scientific exploration; foster their curiosity; enhance their enthusiasm for science; and enable them to apply scientific knowledge and reasoning to personal, professional and public decision-making. Lab courses must meet all five learning outcomes. Non-lab courses must meet learning outcomes 1 through 4. Labs and Fieldwork courses must meet learning outcome #5.

To achieve these goals, students will:

1. **Scientific Method**: Understand how scientific inquiry is based on investigation of evidence from the natural world, and that scientific knowledge and understanding:
   a) evolves based on new evidence
   b) differs from personal and cultural beliefs

2. **Scope and Limits of Science**: Recognize the scope and limits of science.

3. **Science and Society**: Recognize and articulate the relationship between the natural sciences and society and the application of science to societal challenges (e.g., health, conservation, sustainability, energy, natural disasters, etc.).

4. **Scientific Literacy**: Evaluate scientific information (e.g., distinguish primary and secondary sources, assess credibility and validity of information).

5. **Labs and Fieldwork**: Participate in scientific inquiry and communicate the elements of the process, including:
   a) Making careful and systematic observations
   b) Developing and testing a hypothesis
   c) Analyzing evidence
   d) Interpreting results

Approved Courses and Enrollment

Students are required to pass two approved science courses, with at least one course that includes a laboratory experience, or transfer in appropriate courses. During the assessment period, 68 courses were approved to meet the Natural Sciences requirement for overview (no lab required) and lab science (see Table 20).

Natural Sciences courses enroll almost 13,000 students each year. Average lecture class sizes vary from 14 in Computational Data Sciences to almost 100 in Biology and Chemistry, though
sections can top 300. Labs maintain smaller class sizes for focused, practical instruction—on average, about 20 students, but this also varies by department. Tables 18-19 and figure 36 show enrollment trends over the past five years. Physics and Astronomy is currently the highest enrolled department (31% of AY19 enrollment), followed by Biology (23.7%) and Chemistry (15.2%).

Courses Included in Assessment

The assessment period included 102 sections of Natural Sciences lecture courses taught on all of Mason’s campuses and via distance learning in fall 2019. Of the 95 course sections included in the assessment period, 92.6% submitted materials. Of the 289 lab sections taught in fall 2019, 73 (25%) were randomly selected for the assessment; 88% provided materials.

Enrollment and Grades Distribution

A total of 6,758 students enrolled in Natural Sciences lecture courses in the assessment period. The highest enrolled five enrolled courses were BIOL 103 (13.3% of Fall 2019 enrollment), CHEM 211 (12.8%), BIOL 213 (9.1%), GEOL 101 (6.3%), and PHYS 243 (6%). See Tables 18-19.

Of the enrolled students, 89.4% students in Natural Science Overview (NSO) lectures passed their course with a C or above, and 79.8% of students in Natural Science with Lab (NSL) lectures passed their course with a C or above. An independent-samples t-test found that students in NSO courses (m=3.17, p<.05) had significantly higher grades overall than students in NSL courses (m=2.70, p<.05). Figure 32 displays final grades by course category.

As part of a related project on STEM gateway courses, student enrollment data from AY17-19 were analyzed to understand academic performance in several courses. At interest was performance in introductory STEM courses that were math-heavy (CHEM 211/212, CS 112, PHYS 160/260) versus those that did not require high levels of math (BIOL 213/214, PHYS 243/245). It turns out that courses that the grades in math-based courses (m=2.33) were nearly four-tenths lower, on average, than grades in non-math-based courses (m=2.73). See Figure 37.
Assessment Methods

Three kinds of work samples were collected for this assessment:

1. Project or homework samples from lecture courses representing any of the learning outcomes #1-4.
2. Exams and scores from lecture courses representing any of the learning outcomes #1-4.
3. Lab report samples from lab courses representing outcome #5.

Faculty were asked to submit samples that represented student submissions completed in the final third part of the semester and that allowed students to demonstrate their learning on one or more of the Natural Sciences learning outcomes. Samples were selected using randomized course enrollment lists to insure the best possible representative sample.

The Mason Core Rubrics for Natural Science Courses were used for this assessment. The rubrics were developed by Mason faculty as tools to assess individual student work. The first rubric focuses on outcomes #1-4 and was used for samples from the lecture sections. The second rubric focuses on outcome #5 and was used to assess lab reports. Both rubrics are modeled after the VALUE rubrics and use four performance descriptors: Novice, Developing, Proficient, Advanced, as well as an option for "no evidence." The performance descriptors are developmental, identifying student performance levels in a context of learning and growth.
The rubrics are intended to be used across all of the years of a student’s college experience, and is not limited to a single course, assignment, or student class level.

Using a process modeled after the VALUE Institute reviewer calibration, faculty reviewers were trained to use the rubrics to assess student work. Reviews were normed to produce consistent ratings across reviewers. Reviewers met for an in-person, one-day training and review session and completed the reviews of student work by the end of the day. Reviewers were faculty members who have taught Mason Core Natural Sciences courses. Reviewers earned a small stipend for their efforts. Each student work sample was assessed twice.

Learning Outcomes Assessment Results

Lecture Samples – Project Samples

Figure 33 displays results from 201 ratings on the rubric for lecture courses (Outcomes #1-4). Across the outcomes, 20% of samples were rated as “no evidence,” meaning that the learning outcome was not identified in the sample. Samples were rated as Novice or Proficient 44-54% across the outcomes, which is to be expected for 100- and 200-level courses. A Pearson’s Chi-Square test did not reveal differences between NSO and NSL lecture samples.

Figure 33. Assessment Results for Project Samples from Lecture Courses

N = 201

Lecture Samples – Exams

It is common for large lower-division lecture courses in the sciences to use multiple-choice exams as their primary, or only, form of assessment. For courses that use only these kinds of
exams, faculty were instructed to submit a document that mapped items from a selected exam to the Mason Core learning outcomes, and then submit student performance data for these items. While most faculty submitting exams did complete this activity, the submissions were inconsistent, and it proved unworkable to compile the results in any meaningful way. Thus, exam data were not included in the assessment results. In future, should this kind of assessment be conducted again, it will be important to solve this challenge.

**Lab and Fieldwork Report Samples**

Lab and fieldwork reports for general education science courses contain similar elements across disciplines, thus we have reasonable confidence that the rubric used for this assessment was valid. Figure 34 displays results from 318 ratings on the Lab Reports Rubric. A Pearson’s Chi-Square test revealed differences between 100- and 200-level courses. Samples from the 200-level courses were rated significantly higher for outcomes 5a and 5c only. It should be noted that in the development of the rubric, faculty claimed that it would be unusual for a lab course at the lower-division to expect students to develop a hypothesis; this is partially seen in the results.

**Student Self-Assessment**

All students who were enrolled in a Mason Core Natural Sciences course during the assessment period received an online self-assessment survey at the end of the semester. The retrospective pre-post self-assessment asked students to rate their knowledge and skills on five learning outcomes at the beginning of the semester (pre), and then again at the end of the semester (post). In total, 343 students completed both the pre and post items, resulting in a 5.1% response rate. A t-test pairwise comparison showed significant perceived learning gains on all five outcomes; no significant differences were found between NSL and NSO courses (see Figure 35).

**Figure 35. Mean Scores on Student Learning Self-Assessment**

Mean scores, self-reported on a scale of 1-4, n=343, *p < .05

**How do the Results Meet Expectations?**

Because this was the first time that these rubrics were used for the assessment of student work products, and because so much of the student work collected from lecture courses could not be assessed using the rubrics, it seems most appropriate to consider these results as preliminary and descriptive. More work is necessary to understand how well the rubrics can be used to assess general education science outcomes. Natural Sciences faculty should consider these results in terms of the learning outcomes identified for their academic programs.
How are Results Being Used to Improve Students' Educational Experience?

As of this writing, results have not yet been shared with the Mason Core Committee nor the Natural Sciences faculty.

Limitations of this Assessment

As this was the first time that Natural Sciences learning outcomes were assessed using this method, caution should be taken in interpreting the results. The number and nature of the work samples received were insufficient to test the lecture rubric for validity and reliability. The rubric for lecture courses shows promise as a tool for guiding the language and expectations for the Mason Core Natural Sciences, allowing faculty to plan learning experience that support development of these skills from first through senior years. However, it is not clear that the rubric can be used as an effective assessment of student work.

In general, the working group for this category was challenged to locate and select assessment tools for general education learning outcomes. While the faculty working group agreed that the Mason Core learning outcomes were appropriate and valuable for the program overall, they identified multiple challenges for operationalizing the outcomes for teaching and assessment in discipline-based courses. A reconsideration of how the learning outcomes for the sciences are used in the Mason Core is warranted.

Assessment Rubric(s)

The Natural Sciences rubrics were developed by a team of Mason Natural Sciences faculty to evaluate student work for the Mason Core learning outcomes in the Natural Sciences. The rubrics were modeled after the AAC&U VALUE rubrics and were informed by existing rubrics from New Mexico Statewide General Education Steering Committee (2018), University of Nevada Reno (nd), and Delaware State University (2016). The rubrics are designed to evaluate student performance on five learning outcomes, with four increasingly sophisticated performance descriptors for each outcome. The rubrics can be used with student projects or similar work products (not suitable for exams), and with lab or fieldwork reports. Most student work will not show evidence of all outcomes; in this case, an additional category for “no evidence” should be made available.

## Mason Core Rubrics for Natural Science Courses

### Student Learning Activities Rubric for Lecture Courses

Learning Outcomes 1-4: METHODS, SCOPE AND LIMITS OF SCIENCE, SCIENCE AND SOCIETY, AND SCIENTIFIC LITERACY

**How to use this rubric:** This rubric describes the progression in understanding that students should demonstrate as they advance through Mason Core (general education) courses in the Natural Sciences. It is intended to provide guidance to faculty members designing courses and assessment tools and should not be viewed as establishing expectations for a certain level of achievement at the end of a single general education science course. Faculty members are encouraged to use the rubric to establish the level of understanding, for each component of knowledge, they would like to see students achieve in their course. For more information about the learning outcomes and approved courses, [https://masoncore.gmu.edu/natural-science-lab-and-non-lab/](https://masoncore.gmu.edu/natural-science-lab-and-non-lab/)

<table>
<thead>

<th>Student Learning Outcomes</th>
<th>Level of Performance</th>
</tr>
</thead>
</table>
| **SCIENTIFIC METHOD:** Understand how scientific inquiry is based on investigation of evidence from the natural world, and that scientific knowledge and understanding: • evolves based on new evidence • differs from personal and cultural beliefs | **Advanced**
Demonstrates understanding of the scientific method by formulating questions about nature; articulates the relationship between evidence and theory, how these are used to build an argument. | **Proficient**
Demonstrates understanding of how the scientific method is implemented; describes the relationship between evidence and theory and how the two are used to build an argument. | **Developing**
Articulates the relationship between evidence and theory in a simplistic way; provides limited explanation of how the two are used to build an argument. | **Novice**
Shows minimal understanding of the difference between evidence/data and explanation/theory. |
| **SCOPE AND LIMITS OF SCIENCE:** Recognize the scope and limits of science (see notes on page 3) | **Advanced**
Clearly articulates the scientific issue/problem, explains how it fits within the discipline's sphere of inquiry, and describes multiple approaches to addressing it. | **Proficient**
Clearly identifies and describes the scientific issue/problem; demonstrates general understanding of how it fits within discipline's sphere of inquiry. | **Developing**
Identifies the issue/problem; offers simplistic explanation of how it fits within discipline's sphere of inquiry. | **Novice**
Unable to identify the issue/problem; demonstrates little or no understanding of discipline's sphere of inquiry. |

Notes on the Scope and Limits of Science

*Defining the Boundaries of Science and Scientific Inquiry*

The scope and limits of science define the boundaries of what questions science is equipped to address. Science deals with questions of the physical world. The scientific method addresses questions for which a hypothesis is testable and falsifiable, and experiments and observations are repeatable. Science can address important questions, make predictions, and create useful technologies. Science tells us how the world is.

Modern science can address many questions and solve many problems, but there are limits to its reach. Areas of limitations include questions about value, questions of morality, questions about the supernatural, and questions about “ultimate reality.”⁴ Science reaches its limits at questions such as: What is beauty? How should a problem be solved? What are ethical solutions? What are moral actions? What is our purpose in the world? Science does not tell us how to use scientific knowledge.

Seven aspects of the Nature of Science that define science as a discipline²:

1. Scientific knowledge is subject to change.
2. Knowledge is empirically based.
3. Knowledge is theory laden and subjective.
4. Knowledge is the product of human imagination and creativity.
5. Knowledge involves the combination of observation and inferences.
6. Laws and theories play an important role in developing new ideas.
7. Scientific ideas are validated by repetition and peer review.

Lab Reports Rubric

Learning Outcome 5: SCIENTIFIC INQUIRY

Laboratory sections in the Mason Core are designed to support students to achieve the following outcome with five sub outcomes listed in column one.

Students will participate in scientific inquiry and communicate the elements of the process, including:

<table>
<thead>
<tr>
<th>Student Learning Outcomes</th>
<th>Level of Performance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Advanced</td>
</tr>
<tr>
<td>5a. Make careful and systematic observations</td>
<td>Data/observations are accurately recorded. All representations of data/observations are clear, complete, and appropriate for the scientific information collected.</td>
</tr>
<tr>
<td>5b. Develop a hypothesis</td>
<td>Presents multiple relevant, testable hypotheses as appropriate to the questions; connection between hypothesis and the scientific issue is clear and insightfully and fully integrates the appropriate scientific concepts.</td>
</tr>
<tr>
<td>5b. Test a hypothesis</td>
<td>Method is well documented, including sufficient detail so that experiment can be easily repeated.</td>
</tr>
</tbody>
</table>
### Mason Core Rubrics for Natural Science Courses

<table>
<thead>
<tr>
<th>Student Learning Outcomes</th>
<th>Level of Performance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Advanced</td>
</tr>
<tr>
<td>5c. Analyze evidence</td>
<td>Analysis is thorough and insightful and goes beyond the obvious connections to demonstrate complete grasp of relevant course concepts.</td>
</tr>
<tr>
<td>5d. Interpret results</td>
<td>Summarizes results correctly. Conclusions are accurate and insightfully link results to both the relevant scientific concepts and the original hypotheses and predictions.</td>
</tr>
</tbody>
</table>

Language for both rubrics was adapted from the following sources:
